

Code Snippet 1

```
db = open("output.txt", "w") # Changed to "w" mode to overwrite and create file
a = "Hello" + str(1) # You can sum a string with an integer, so I transformed 1 in a string
b = "How do you do?"
db.write(a + ", " + b + "\n")
db.close() # I wrote this line to close the db
```

Code Snippet 2

```
def findTotal(a):
    total = sum(a) # i never existed, so I summed a as the total
    print(total * 2) # Now I printed the total times 2 as the original code implies

findTotal([1, 2, 3, 4]) # Making sure the code is right.
```
